

## Climate Prediction Center's Afghanistan Hazards Outlook 8 July – 14 July, 2021

### Temperatures

During the last week of June, maximum temperatures averaged near or slightly warmer than normal over Afghanistan. Minimum temperatures were near normal. Observed maximum positive temperature anomalies reached 2-4°C. Maximum temperatures in the southwest ranged from 40-45°C.

During the outlook period, forecasted weather disturbances could bring cooler-than-normal weather to northeastern Afghanistan. Negative anomalies are forecasted to be 1-4°C. Slightly warmer than normal conditions are anticipated elsewhere with 1-4°C anomalies.

### Precipitation

Dry conditions prevailed across the nation during the past 7 days with little to no observed rainfall. Conditions have been drier than normal in northeastern Afghanistan over the past 30 days with anomalies of 10-50mm. For the outlook period, the northward extension of the Indian Monsoon could bring light to moderate rains in eastern Afghanistan. Weekly totals are likely to be 10-25+mm.

**Note:** The Hazards outlook map is based on current weather/climate information, short and medium range weather forecasts (up to 1 week), and assesses their potential impact on crop and pasture conditions. Shaded polygons are added in areas where anomalous conditions have been observed. The boundaries of these polygons are only approximate at this continental scale. This product does not reflect long range seasonal climate forecasts or indicate current or projected food security conditions.
