

Climate Prediction Center's Afghanistan Hazards Outlook November 28 – December 4, 2019

Temperatures:

From November 17 – 23, mean temperatures averaged below-normal over the northern provinces of Afghanistan, where cold anomalies ranged between 3-7 degrees Celsius. In contrast, temperatures were slightly above-normal over the eastern and northern portions of the country. During the next outlook period, near to above-normal temperatures are forecast over much of Afghanistan. Meanwhile, minimum temperature is forecast to possibly fall below -25 degrees Celsius over the northeast mountain.

Precipitation:

During the past observation period, widespread light to moderate (< 50 mm) precipitation was observed across the eastern two-thirds of Afghanistan. Over the past thirty days, above-average precipitation was registered over the central highlands and southern parts of the country. During the next outlook period, drier weather pattern, with mostly suppressed precipitation is forecast over much of Afghanistan. However, heavy (> 20 cm) snowfall is possible over portions of the northeast mountain region.

Note: The Hazards outlook map is based on current weather/climate information, short and medium range weather forecasts (up to 1 week), and assesses their potential impact on crop and pasture conditions. Shaded polygons are added in areas where anomalous conditions have been observed. The boundaries of these polygons are only approximate at this continental scale. This product does not reflect long range seasonal climate forecasts or indicate current or projected food security conditions.
