Haiti Weather Hazards Assessment

For

November 24 – November 30, 2005

Moisture associated with a frontal system has the potential to produce some locally heavy rainfall in portions of north-central Dominican Republic early in the period. This region has been mainly quiet for the past few weeks so this shot of moisture will most likely be beneficial to crops, however depending on the amount of rain and its rate of falling some localized flash flooding may take place and the possibility for landslides may occur.
