

## The USAID FEWS-NET

### Haiti Weather Hazards and Benefits Assessment

For  
July 26 – August 1, 2007

Rainfall during the first season was plentiful. There was a sufficient break in the rains to allow the crops to dry down, and to allow first season harvesting and second season sowing. Now rainfall has returned to Hispaniola. During the last week rainfall continued to fall across most of the island. Some of this precipitation was heavy, likely causing localized flooding. Lighter rainfall is likely during the coming period.
