

Climate Prediction Center's Afghanistan Hazards Outlook September 17 – September 23, 2020

Temperatures:

During the past week, temperatures were generally near average across Afghanistan. Some areas of western Afghanistan experienced slightly below-normal minimum temperatures. Meanwhile, an area of western Afghanistan in Herāt and Ferāh provinces observed some above-normal maximum temperatures that exceeded 40°C. During the outlook period, maximum temperatures are forecast to be close to normal with a few small negative anomalies in the central highlands and some positive anomalies in the east. Minimum temperatures are forecast to be warmer than normal in the south and east, but subfreezing temperatures are expected in the central highlands

Precipitation:

During the past week, a few scattered light rain showers were observed in northeastern Afghanistan. 7-day rainfall totals were about 10mm or less. The rest of the country remained dry. During the outlook period, a few stray showers are expected across northeastern Afghanistan. 7-day totals of 2-10mm are forecast by weather models.

Note: The Hazards outlook map is based on current weather/climate information, short and medium range weather forecasts (up to 1 week), and assesses their potential impact on crop and pasture conditions. Shaded polygons are added in areas where anomalous conditions have been observed. The boundaries of these polygons are only approximate at this continental scale. This product does not reflect long range seasonal climate forecasts or indicate current or projected food security conditions.
