Central America Weather Hazards Assessment

for

June 2 - 8, 2005

Hazards Assessment Text Explanation:

Rainfall so far this season has been adequate to locally excessive. As a result, dryness is not a major concern at this time. Seasonal rains are expected across the region, with some locally heavy rains expected. Although some localized flooding is possible across places like Panama, Costa Rica, southern Nicaragua and Guatemala, widespread flooding is not expected. As a result, no major weather hazards are anticipated during the assessment period.
